

2022/23

Worth Park conservation report

*Conserving and increasing
biodiversity at Worth Park*

Upper Italian terrace

Worth Park in brief

Worth Park is a well-used park of 8.5 hectares in Crawley.

The park's complete restoration using Heritage Lottery, Big Lottery Fund and other funding sources in 2013 provided the catalyst and inspiration to create and develop this important community and destination park as an environmental and conservation centre of excellence.

The project aspiration was the conservation of the park's natural (plus built and social) heritage so it can be appreciated and loved by park users today and in future.

Six years post-restoration, the twin underlying benefits of the park's central position and strong community connections have strengthened this ambition, helping the park create new partnerships, initiatives and activities that are continuing to extend sustainability measures and messages beyond the park's boundaries.

Did you know?

The park was originally a medieval deer park and formed part of the larger Forest of Worth.

Cinnabar moths help control ragwort

Key points on conserving and increasing biodiversity at Worth Park

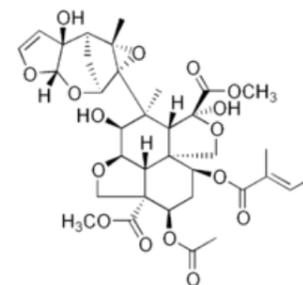

Worth Park has had a zero-pesticide (pesticide, herbicide and fungicide) practice in place since April 2019.

- Many pesticides have an effect on pollinators and other wildlife, they also have a negative effect on soil ecology that would lead to alterations to plant health
- We use alternative methods to pesticides such as plant diversity, which means a better healthier eco-system that not only provides home and food for our pollinators but can also encourage predatory insects that will feed on your unwanted pests.

Insects like ladybirds and their larvae, hoverfly larvae and lacewing larvae as well as beetles, parasitic wasps, birds, reptiles and more. (All of which are a form of pest control that nature intended).

- The beautiful day time flowering moth called the cinnabar moth 'Tyria jacobaeae' is a form of natural control (biocontrol) for the ragwort (weed)
- Neem oil (bio-pesticide) is also used to control aphids, especially on our rose bushes
- Neem oil does not kill the rose aphid 'macrosiphum rosae' but merely puts it off its food and disrupts its breeding cycle but does not affect the predatory insects or birds that may feed on them

- Surprisingly neem oil has many other benefits as well (diagram below).

Sunscreen

We don't use artificial fertilisers to feed our plants; instead we use organic matter like leaf mulch, which has a perfect carbon ratio between 30-80 parts carbon to one part nitrogen (30-80:1). We also use spent coffee as a soil conditioner which can accelerate the composting process.

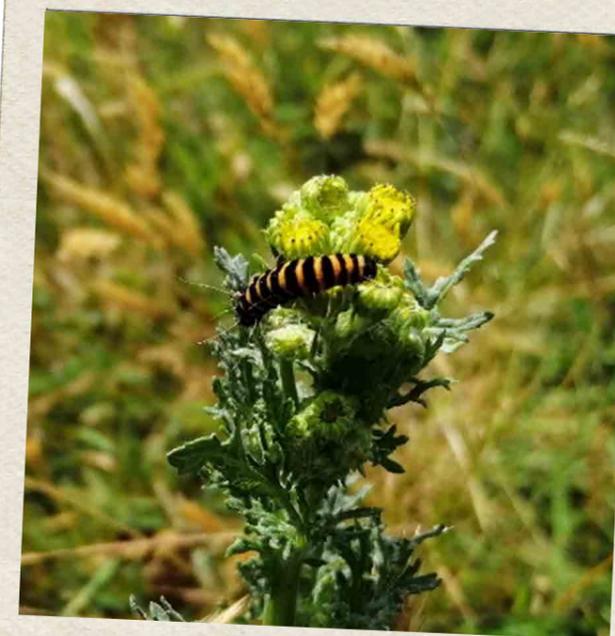

Worth Park now recycles approximately 75 per cent of its green waste through the process of composting, which includes grass clippings, small prunings, edgings and leaves.

Once the compost is of good quality (humus rich) we use this on our herbaceous borders and rose borders to improve the soil's health.

Lets also mention that healthy soil can lock in three times more carbon than a tree. Basically it is (carbon sequestration) – The process of capturing and storing atmospheric carbon dioxide.

Worm composting

Caterpillar of the cinnabar moth feeding on ragwort

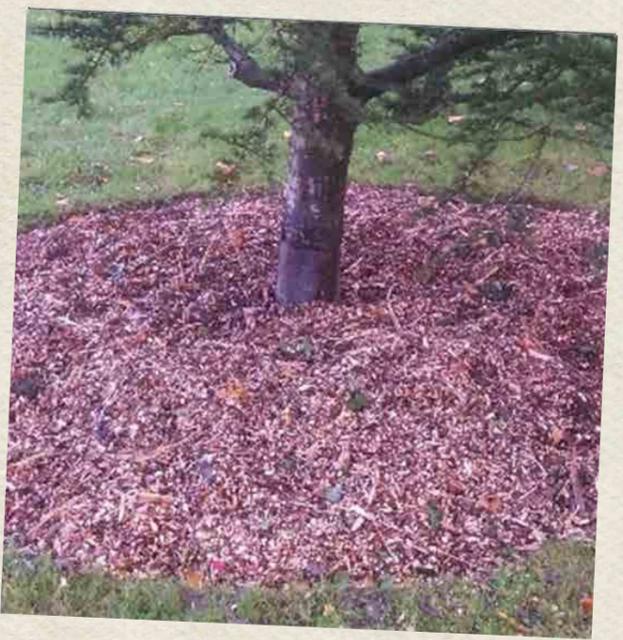

Mulch

We mulch some of our borders, trees and plants and the reason for doing so is to impede weed growth, retain moisture, to promote better root growth and at the same time it gives a professional appearance.

Mulch will provide a home for many soil macro and micro-organisms as well as fungi and insects that will slowly convert this mulch into a humus-rich soil.

Certain mulches, such as willow bark and eucalyptus could be beneficial to the trees as they contain phytoncides (phytoncides work by preventing attacks by bacteria, fungi and insects).

Photo (left): a mulch pit around a tree at Worth Park (95 trees at Worth Park now have mulch pits around them).

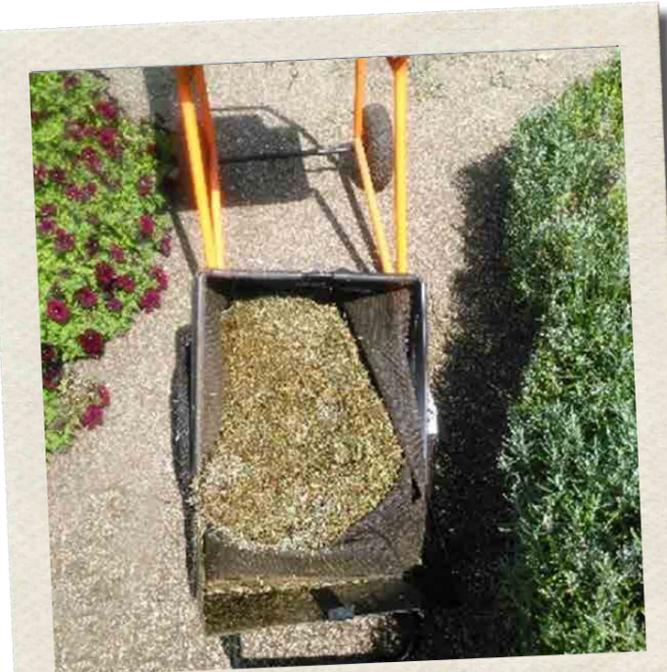

One of 95 mulch pits at Worth Park

Plants such as cornus and salix are cut back at their correct times and are shredded, the chippings from this process are used as a form of mulch that it is placed around the plants.

Photo (right): Lavender hedge trimmings passed through the shredder (100 per cent recycled).

The mulch is then placed back onto the borders and dug in; this process will enrich the condition of the soil.

Remember good soil management means better healthier plants that are more resilient to pests and diseases.

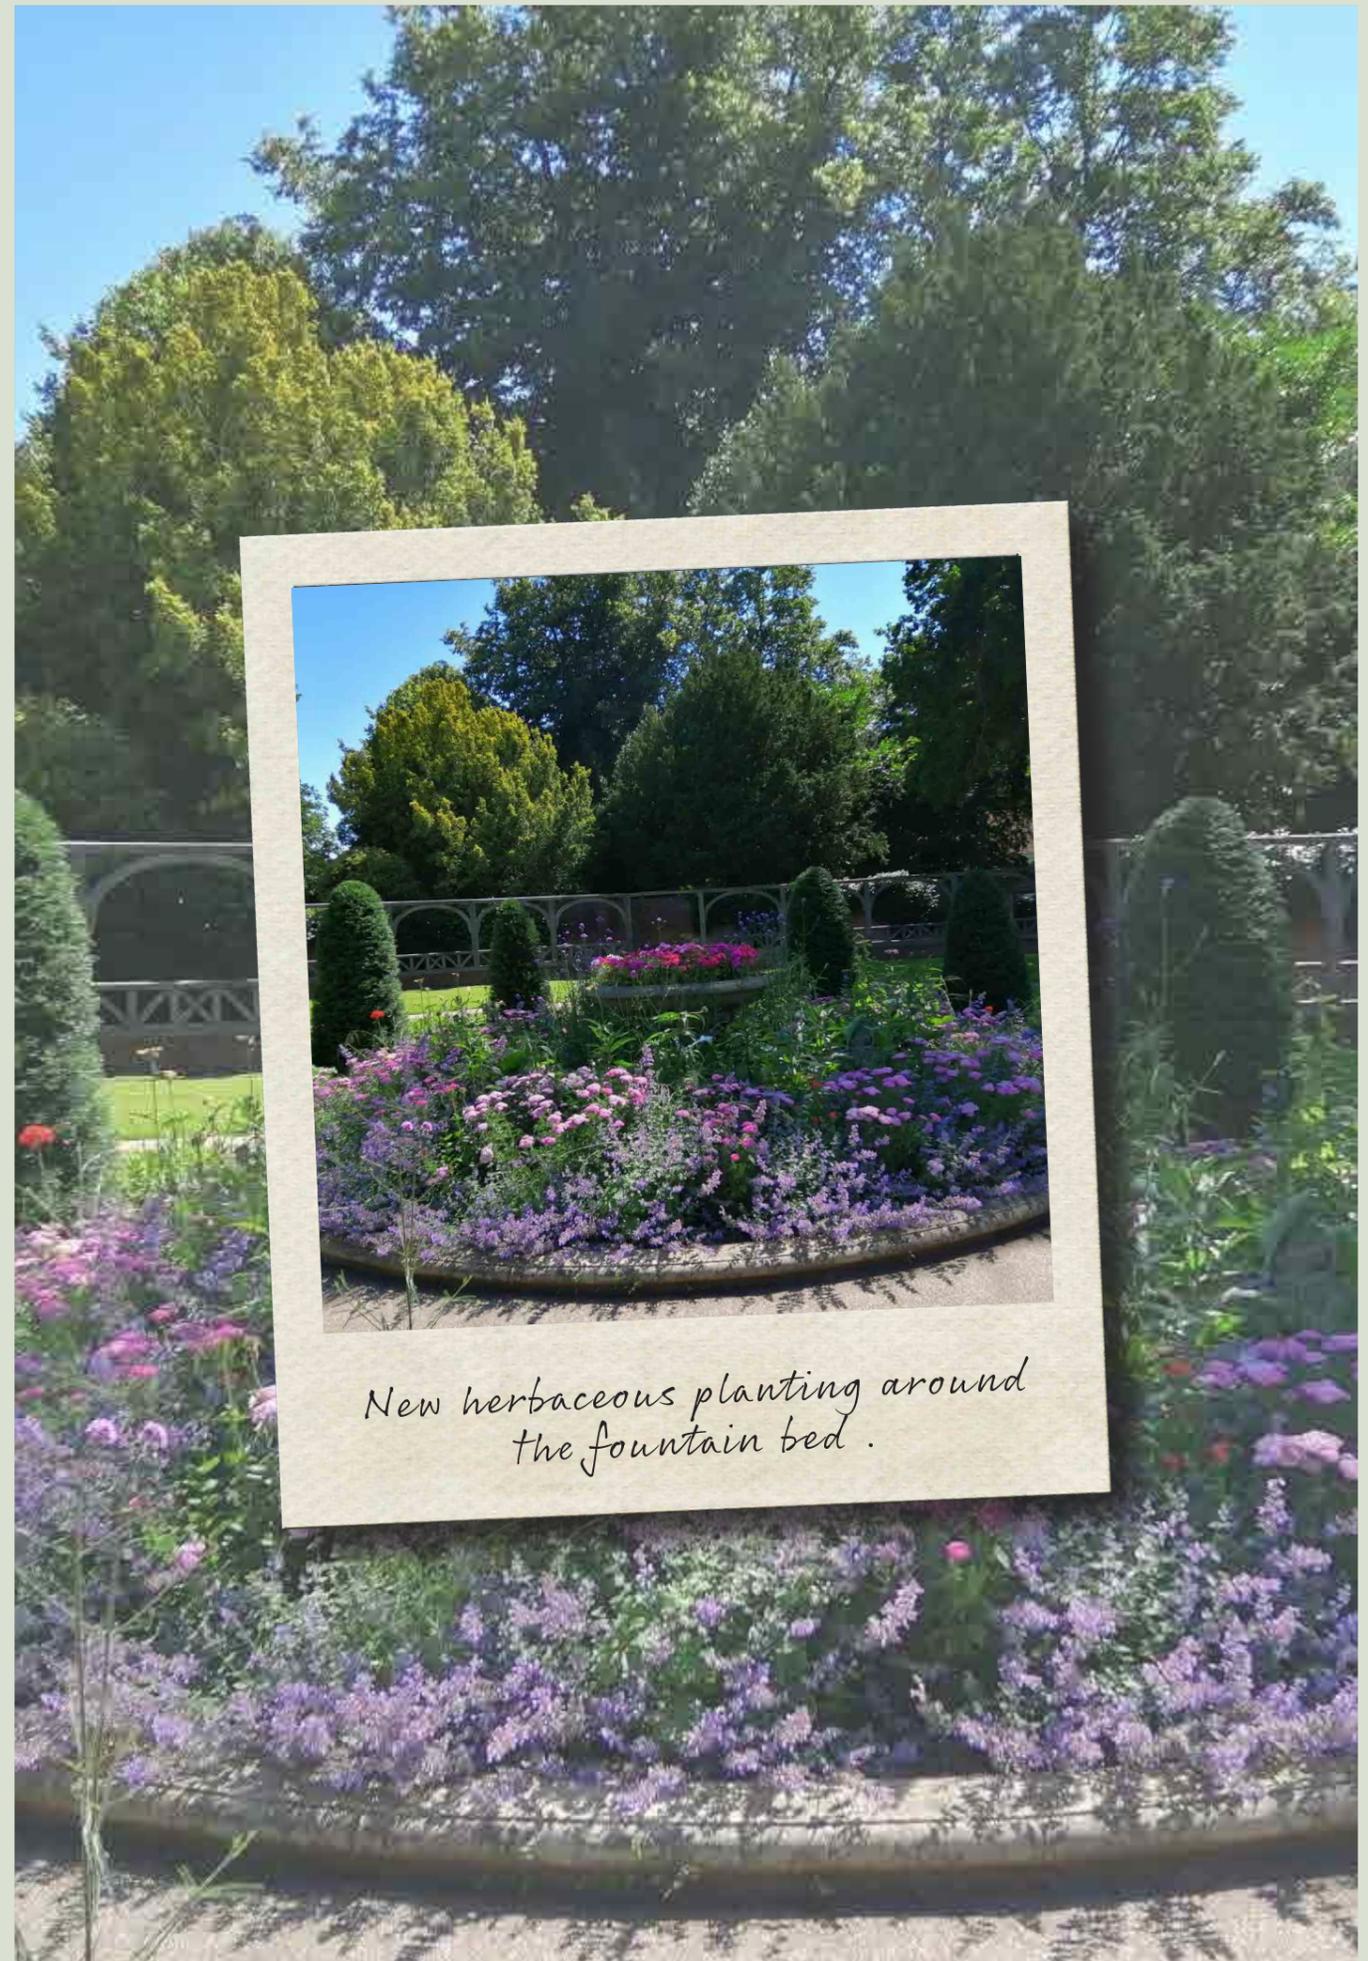

Making mulch from lavender

Worth Park now recycles approximately 75 per cent of its green waste through composting clippings, prunings and leaves.*

If we don't take action, the collapse of our civilisation and extinction of much of the natural world is on the horizon.

Taraxacum officinale

Cichorium intybus

Pollinators

There is no doubt that our pollinators worldwide are in drastic decline and face an uncertain future and possible extinction.

That is why we are increasing plant diversity at Worth Park to provide our essential pollinators with food (maximize the period when pollen and nectar are available) and home they deserve.

So far, we have increased plant diversity of flowering trees, shrubs, herbaceous perennials and wildflowers by 45 per cent and diversity means a better healthier ecosystem. A healthier ecosystem means that it is more effective at carbon sequestration.

There is also an increase in no-mow zones by approximately 15-18 per cent and this will in turn be beneficial for providing a home and food for pollinators and other wildlife.

An area of lawn that is no longer mowed or cut can increase biodiversity by 30-35 per cent.

Weeds

What people classify as weeds, such as dandelion, clover, chicory, common thistle, knapweed, yarrow etc., are in fact an essential pollen and nectar source for pollinators.

Spear thistle

'Cirsium vulgare' for example is a plant that produces a great amount of nectar for pollinators and is ranked in the top 10 for most nectar production. The seeds from this plant are eaten by greenfinches, goldfinches and linnets.

Dandelion

'Taraxacum officinale' are perfect for pollinators such as bumblebees, hover flies, butterflies, honey bees and day flying moths, especially in early spring when there are fewer floral pickings.

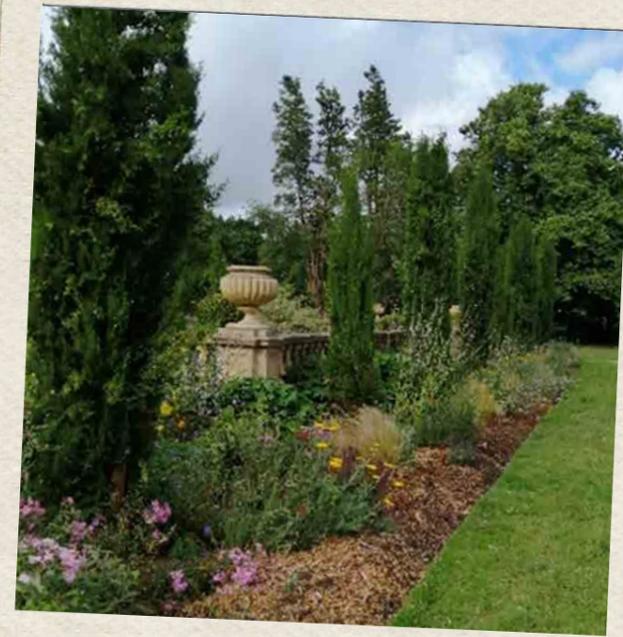

Chicory

'Cichorium intybus' is a great plant for pollinators with its long flowering period from late spring to early autumn and is featured within the RHS perfect for pollinator list. It can also make a great addition to any herbaceous border planting scheme.

In fact, we now include many wildflowers within our new border designs to demonstrate that these plants can go grow well with any cultivar plant and provide an essential service for pollinators, plus they provide visual delight to members of the public.

Photo (top right): This border contains knapweed, yarrow and chicory plants.

In early 2020 we planted 250 achilleas of 10 different varieties within a gravel area adjacent to the croquet lawn. Not only do they provide a colour-changing tapestry of flowers but are perfect for pollinators, especially for butterflies and hover flies as they have ideal landing platforms.

Pests and diseases

Climate change is increasing pest and fungal pathogens that are affecting our plants, therefore we have to be more vigilant and keep up-to-date on new threats.

At Worth Park we keep up-to-date on pests and diseases via the Department for Environment, Food and Rural Affairs and the Animal and Plant Health Agency websites as well as other sources.

Effective biosecurity methods at Worth Park:

- Enhanced skills in pest and diseases recognition
- Early detection and reporting to increase the chances of effective control
- Sourcing plants via recommended nurseries (plant passport)
- Good husbandry of tools (clean and disinfect) on a regular basis to minimise spread of plant diseases
- Plant diversity and adaption to climate change
- Good soil management.

Trees

We have now planted nearly 64 new trees of 18 different varieties in the last 14 months or so (see diagram across page) to increase tree diversity and to expand our arboretum.

Trees are so beneficial to our ecosystems and our health.

- Trees can absorb 22 tonnes of carbon dioxide in their trunks, branches and roots in their lifetime
- Trees act as air filters by removing dust and absorbing dangerous pollutants such as carbon monoxide, sulphur dioxide and nitrogen dioxide
- Every day in summer, trees can release 29 tonnes of oxygen into the air per square mile of forest
- Trees are motherships of biodiversity with their unique habitats of birds, insects, lichen, fungi, plants and other wildlife
- The fallen leaves make excellent compost that enriches the soil and this in turn means better, healthy trees and plants
- Flowering trees provide a great food source for pollinators.

Ginkgo biloba
(Maidenhair tree)

Arbutus unedo
(Strawberry tree)

Future plans and aspirations

- Increase plant and tree diversity

- Provide home and food for pollinators and other wildlife

- To engage with the wider public on the importance of pollinators

- To encourage gardening the natural way without the use of pesticides

- Increase onsite composting

- Increase propagating of onsite plants via division, hardwood cuttings and other methods (biosecurity)

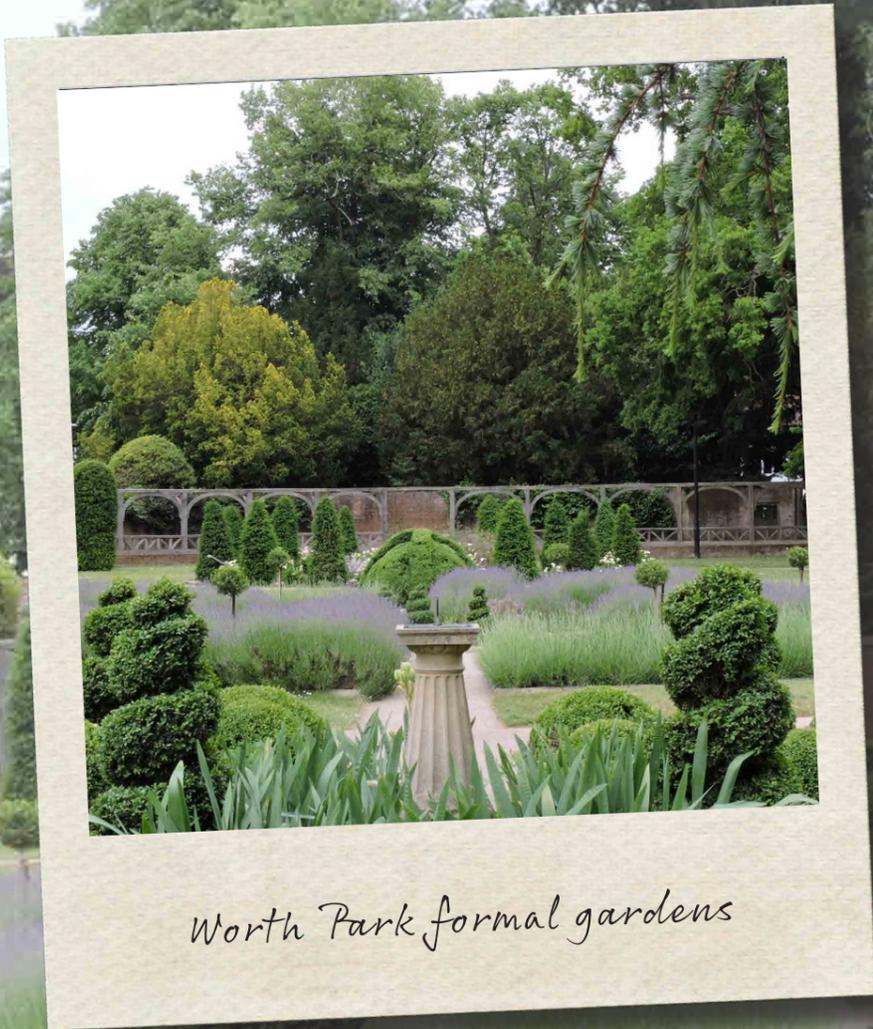

- To have more wildflower (meadow) areas

- To decrease the use of petrol machines and go electric

- To increase climate change planting projects.

Worth Park formal gardens

Climate change

Sometimes by relinquishing control of certain areas, increasing plant diversity and doing things more horticulturally and ecologically correct we can not only create more friendly areas for nature to return but it can also have a positive impact on CO2 levels and wellbeing. Worth park is now a nexus of biodiversity, climate and pollution resilience.

Bumblebee

Dead hedging

Dead hedging

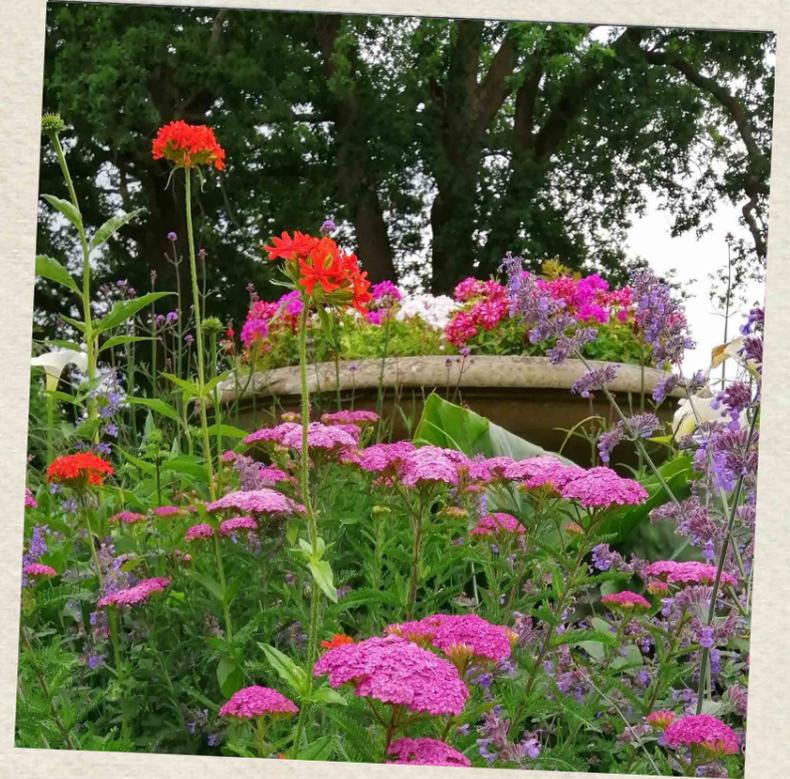

Basically the concept of dead hedging is to hammer in upright wooden poles into the ground of about 30-50cm apart and then slowly fill it up with organic matter such as clippings, leaves and dead wood.

The dead hedge then becomes a great location for insects to make their home in (bug hotel) as well as fungi, small mammals, bumble bees and birds can pillage from it to make nests.

It's a great way to recycle and reuse your green waste.

WORTH PARK

A UNIQUE VICTORIAN GARDEN

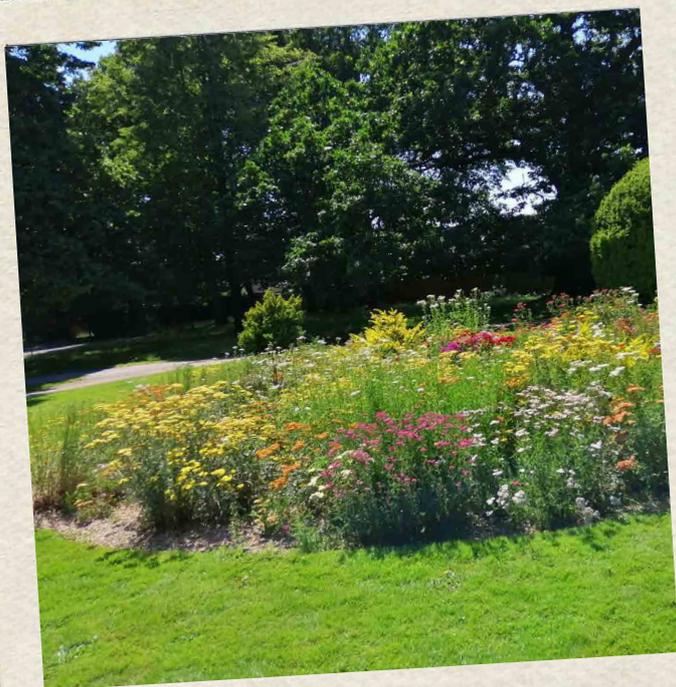

The park

Worth Park has beautiful formal gardens, including the camellia walk; a restored Pulhamite rockery and Victorian fountain; arboretum; herbaceous borders; a lake surrounded by many species of trees and wildflowers; croquet lawns and a tennis court, and Ridleys cafe.

The park is open 24 hours a day. Toilets and parking are available at the Visitor Centre in Ridleys Court.

Our award-winning trees

To find out more about British and Ireland Champion Trees please visit treeregister.org

Achillea bed

What's on

Crawley Croquet Club

Between April and October at the lawns.
For further information contact Anne Jenkinson on **01293 884469**.

Worth Park Costume Group

Every Thursday, 2-4pm (term time only) at Ridleys Court. **All levels of experience welcome.**

Worth Park Friends

Ambassadors of the park, raising awareness of the history of the gardens and organising clean up days and fundraising events. **For more information on biodiversity and other news visit worthparkfriends.org or call 01293 882275.**

Worth Park Gardening Club

Every Wednesday from 10am at Ridleys Court. **No experience needed, all ages welcome and tools will be provided.**

Worth Park History Society

Third Tuesday of the month, 2-4pm (no meeting in August) at Ridleys Court.
Discover and explore the history of Worth Park and surrounding areas.

Worth Park Wanders and wellbeing walks

Both are free and start from Ridleys Court with refreshments afterwards.
For more information visit crawley.gov.uk/worthpark
